DETAILED TABLES

Table	Page
1. Marital status by age, race, farm-nonfarm residence, and sex: March 1974 and 1970	13
2. Family status of persons 14 years old and over, by age, race, and sex: March 1974	18
3. Family status of persons under 14 years old, by age, race, and sex: March 1974	22
4. Family relationship and presence of parents, for persons under 18 years old, by age and race: March 1974	24
5. Presence of parent, by marital status of parent, for persons under 18 years old living with only one parent, by age and race: March 1974	25
6. Marital status by family status, age, and sex: March 1974	26
7. Marital status of family and subfamily heads, by age and sex: March 1974	29
8. Marital status by household headship, age, race, and sex for regions: March 1974	30
9. Distribution by marital status for males 25 to 64 years old, by years of school completed, income in 1973, and age: March 1974	33

MARITAL STATUS AND LIVING ARRANGEMENTS: MARCH 1974

INTRODUCTION

Recent changes in the marital status of the adult population of the United States are closely paralleled by changes that have occurred in the living arrangements of the total population. For example, high rates of marital disruption through divorce or separation have contributed to the decline in the proportion of children who live in families where both parents are present and to the corresponding growth of female family heads. Similarly, the increasing proportion of younger persons who have established their own households while living apart from any relatives is associated with the trend among young men and women to remain single for a longer period of time than in the past. Additionally, the dissolution of marriages by the death of one spouse has been bringing changes in the living arrangements of the surviving family members at later ages.

This report presents detailed statistics on the marital status and living arrangements of the noninstitutional population of the United States. The report includes information on the marital status of the population 14 years old and over by age, race, sex, and farm-nonfarm residence,

family relationship, presence of parents for persons under 18 years old, and household headship by marital status for regions. The text highlights information on: trends in the age at which men and women first marry; recent proportional increases in young single persons; growth of the number of young persons residing as primary individuals; increases in the ratio of persons who were divorced to those persons in intact marriages; and the living arrangements of divorced persons.

The data presented in this report were derived from the March 1974 Current Population Survey conducted by the Bureau of the Census and are subject to sampling variability, which may be relatively large for the smaller figures and for small differences between figures. For a further discussion of the sampling variability see the section on "Reliability of the Estimates."

AGE AT FIRST MARRIAGE

The median age at first marriage is higher for both men and women than it was in the mid-1950's, but the difference between the median ages of husbands and wives at first marriage

¹Figures for 1947 to 1974 are based on Current Population Survey data supplemented by data from the Department of Defense on marital status by age for men in the Armed Forces. Figures for earlier dates are from decennial censuses.

has declined (table A). The median age for men has risen by about one-half of one year and that for women by about one full year. Since the latter part of the 1960's, the median age at first marriage for men has remained relatively constant at about 23.1 years, while the median for women has continued to move upward to its present level of 21.1 years. During that period, however, the third quartile of age at first marriage (the age by which three-fourths of those who ever marry do so) has increased for both men and women (table B).

Since 1960, the percent remaining single has risen sharply for persons under 35 years of age but has continued to decline among persons 35 years old and over. The increase in the percent single is particularly apparent in the age groups where most men and women have traditionally married. At ages 20 to 24 years, for example, there has been an 11 percentage point increase in the percent single for women, amounting to about a one-third increase above the 28 percent single in 1960. By contrast, the proportion of persons who remain unmarried beyond the age of 35 has declined since 1960; some of these persons were at the principal age for marriage in the 1950's when the average age at marriage was the lowest on record. Whether the tendency among the younger group to refrain from marrying represents merely a postponement of first marriage or a development of a trend toward life-long singleness is not known.

The median and quartile ages at first marriage shown in this report (tables A and B) are approximations derived from tabulations of marital status by age and may yield figures that differ somewhat from those based on annual vital statistics or census questions on age at first marriage. For a discussion of the method used in estimating the median and quartile ages at marriage, see the section on "Definitions and Explanations."

When the figures on median and quartile ages at first marriage for different years are compared, caution should be exercised in the interpretation of small changes. Because of sampling variability of the survey data and the limitations of the estimating technique itself, the errors in the estimates of the median age may be slightly larger than annual changes of one or two-tenths of a year of age. Moreover, there is evidence that computation of the median age at first marriage for men in some years is affected by changes in the distribution by single years of age within the age groups when most first marriages take place; this is particularly true

for the birth cohorts of 1942-1943 and 1946-1947 when unusual month-to-month changes occurred. Annual changes of up to one-half year in the median for men may reflect this latter factor rather than any real change taking place in the ages of men at first marriage.

YOUNG PRIMARY INDIVIDUALS

Coincidental with the recent increases in the proportion of younger persons remaining single for longer periods has been the trend among young men and women to establish households in "nonfamily" living situations as primary individuals. Between 1970 and 1974 the number of households headed by primary individuals increased by 25 percent and represented about 46 percent of the total household increase in the United States during that period. Primary individuals are persons who maintain their own houses or apartments while living alone or with nonrelatives only.

About 60 percent of the 3 million increase in primary individuals during the 1970-to-1974 span was accounted for by persons under 35 years old (table D). Seventy-two percent of the increase in male primary individuals and 45 percent of the increase in female primary individuals were for persons under 35. Despite the rapid rate of increase in the number of these young primary individuals, they still represent only a minority of all primary individuals, having changed from 16 percent in 1970 to 25 percent in 1974. About 3 of every 4 men and women under 35 years old who were primary individuals in 1974 were persons who were reported as having never been married (table E).

Women living as primary individuals are more numerous than their male counterparts, largely because of the greater longevity for women; many elderly women continue to maintain their own homes after they have become widowed. However, among primary individuals under 35, men account for 60 percent of the total.

DIVORCE RATIO RISES

There were 2.3 million men and 3.6 million women in the United States in 1974 who were currently divorced and had not remarried at the time of the survey. Table F shows that there were 63 divorced persons for every 1,000 persons who were partners in intact marriages in 1974. This ratio has risen from a level of 35 per 1,000 in 1960. Further, the ratio has increased by about the same magnitude during the first years of the 1970's as during the entire 1960 to 1970 decade. Thus, between 1960 and 1970 the ratio of divorced persons to persons married

¹Differences shown were derived by using rounded percentages for 1974 and 1960.

Source: 1960 data: U.S. Census of Population: 1960, Detailed Characteristics, U.S. Summary, table 176.

and living with their spouse increased from 35 per 1,000 to 47 per 1,000 and between 1970 and 1974 the ratio increased from 47 to 63 per 1,000. Similar patterns of increase were found for both sexes and for white persons. However, the increase observed for persons of Negro and other races for the 1960 to 1970 period was not statistically significant.

Women had higher ratios than men and persons of Negro and other races had higher ratios than whites. In 1974, there were 49 divorced men for every 1,000 married men who were living with their wife, whereas there were 77 divorced women per 1,000 married women with husband present. The lower ratios for men reflect the higher propensity for divorced men

than divorced women to remarry. The divorce ratio in 1974 for white persons was 58 divorced per 1,000 married and living with their spouse as compared to 112 per 1,000 for persons of Negro and other races.

In 1974 the ratio of divorced persons to persons in intact marriages was higher for those under 45 years old (66 per 1,000) than for those 45 years old and over (59 per 1,000). This represents a reversal of the situation in 1960 when the ratio was 30 per 1,000 for persons under 45 and 42 per 1,000 for persons 45 and over. Thus, although the ratio has increased since 1960 for both age groups, the increase for the younger was more pronounced than that for the older.

LIVING ARRANGEMENTS OF DIVORCED PERSONS

The National Center for Health Statistics estimates that the total number of divorces that occurred in the United States during the 12 months ending with March 1974 was 925,000, an increase of more than 200,000 over the

estimated 703,000 divorces that occurred during calendar year 1970. The increased incidence of divorce in the United States in recent years has stimulated interest on the part of many as to what types of living arrangements are entered into by persons who obtain a divorce and remain for sometime in that status. The majority of divorced men and women were heads of their own households in 1974. However, the proportion who were household heads was higher for divorced women, 81 percent, than for divorced men, 61 percent. Moreover, about 4 times as large a proportion of divorced women (51 percent) than divorced men (12 percent) were household heads with children or other relatives living with them, whereas a higher proportion of men lived as household heads with no relatives present (primary individuals). Most divorced men and women who were primary individuals lived alone in 1974.

About 19 percent of all divorced women were not heads of households in 1974; 14 percent were living with relatives in families and 4 percent were residing as secondary individuals, that is as lodgers, partners, guests, or resident employees in households or group quarters who had no relatives living with them. Among divorced men about 39 percent were not heads of households; 26 percent were living in families and 12 percent were living as secondary individuals.

RELATED REPORTS

Data for 1974 and earlier years on households and families by type were published in Series P-20, No. 266. Statistics on the characteristics of female family heads and the members of their families for 1973 and earlier years are presented in Series P-23, No. 50, "Female Family Heads."

Figures for 1973 on marital status and family status were issued in Series P-20, Nos. 255 and 258. Figures on projections for the United States of the number of households and families from 1975 to 1990 have been published in Series P-25, No. 476. Additional statistics for years since 1947 on subjects covered in this report have been published by the Bureau of the Census in other reports in Series P-20.

Statistics on marital status for 1970 for standard metropolitan statistical areas, counties, urbanized areas, cities, States, regions, and the United States are presented in 1970 Census of Population, Volume I, Characteristics of the Population, chapter B, "General Population Characteristics." Detailed statistics on marital status and presence of spouse by age for 1970 for States and for large counties and standard metropolitan statistical areas are presented in Volume I, chapter D, "Detailed Characteristics." Similar data for the United States and regions, for 1960, have been published in 1960 Census

of Population, Volume I, Characteristics of the Population, Part 1, United States Summary.

The 1970 census report Series PC(2)-4B, Persons by Family Characteristics, presents statistics on the marital and family status of persons 14 years old and over, by age, race, and sex, for the United States as a whole and for urbanized areas, and on persons under 18 years old by presence and marital status of parents, for the United States by type of residence, and for regions. In addition, this report shows all family members by age, sex, and family relationship by characteristics of the families of which they are members, including size of family, number of children, and education, occupation, and income of the family head.

The 1970 census report Series PC(2)-4C, Marital Status, shows detailed statistics on the marital status distribution of the population 14 years old and over by selected social and economic characteristics for the United States. Series PC(2)-4D, Age at First Marriage, shows detailed statistics for the United States on characteristics of persons 14 years old and over by age at first marriage, based on answers to questions on date of first marriage. In addition, the report shows average annual rates of first marriage per 1,000 single persons 14 to 79 years old in 1968 and 1969, for States. Statistics for 1970 on women by marital status, number of children ever born, and age at first marriage, are shown for the United States in Series PC(2)-3A, Women by Number of Children Ever Born.

Table G. LIVING ARRANGEMENTS OF DIVORCED PERSONS BY SEX: 1974 AND 1970

Living arrangements	1974		1970 ¹	
	Male	Female	Male	Female
Total, 14 years old and over.....thousands..	2,333	3,630	1,479	2,640
Percent.....	100.0	100.0	100.0	100.0
Head of household.....	61.2	81.4	64.2	78.2

²1-person households.

DEFINITIONS AND EXPLANATIONS

Coverage. The population in this report includes the civilian noninstitutional population of the United States plus approximately 1,067,000 members of the Armed Forces in the United States living off post or with their families on post in 1974, but excludes all other members of the Armed Forces. However, the data in tables A and B on median and quartile ages at first marriage for males refer to the total male population, which includes, in addition to the above, the male members of the Armed Forces overseas and in military barracks and similar quarters in the United States.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the present survey and in the Current Pop-

ulation Surveys since March 1960 is the same as that used in the 1960 and 1970 censuses but differs from that used in earlier surveys and censuses. Since March 1960 in the Current Population Surveys, farm residence has been determined by the responses to two questions. Owners are asked "Does this place have 10 or more acres?" and renters are asked "Does the place you rent have 10 or more acres?" If the response is "Yes," the respondent is asked "During the past 12 months, did sales of crops, livestock, and other farm products from this place amount to \$50 or more?" If the acreage response is "No," the inquiry relates to sales of \$250 or more. Rural persons in motels and tourist camps, and those living on rented places where no land is used for farming, are not classified as farm population. The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Although the method of determining farm-nonfarm residence has not changed since March 1971, the underlying sampling methods and estimation procedures have changed. For a discussion of changes see *Employment and Earnings*, Volume 18, No. 8, February 1972, pp. 6-9, published by the Bureau of Labor Statistics.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: white, Negro, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except white and Negro.

Marital status. The marital status classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, spouse present," "separated," and "other married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Husband in Armed Forces. When a woman was reported as married but her husband was not enumerated as a member of the same household an additional question was asked to determine whether her husband was in the Armed Forces. Women who were reported as separated were not asked the additional question.

Age at first marriage. The median age at first marriage, as shown in this report, is an approximation derived indirectly from tabulations of marital status and age. In computing this median, several steps are involved. First, the expected proportion of young people who will ever marry during their lifetime is computed. Second, one-half this expected proportion is calculated.

And third, the current age of young people who are at this halfway mark is computed. From the assumptions made and the procedures used, it follows that the date of the survey is also the date when this halfway mark is reached. Half of the young people of the given age who will ever get married had done so prior to the survey date and half are expected to marry in years to come.

The quartile ages at first marriage divide people who will ever marry into four equal groups. The first quartile age is the age at which 25 percent of persons have married, the second quartile age (or median age) is the age at which 50 percent of persons have married, and the third quartile age is the age at which 75 percent of persons have married. The quartile ages are computed from the same distributions and involve the same assumptions as do the median ages.

In estimating the proportion of young people who will eventually marry, errors of 3 or 4 percentage points would affect the final estimate of the median age at first marriage by only 0.1 or 0.2 of a year. For convenience, the proportion ever married among persons 45 to 54 years old was used. Other age combinations could have been used with little change in the results, so long as they included very few persons who would subsequently marry for the first time.

Data on marital status were available by single years of age in censuses and by 5-year age groups in the sample surveys. Sprague's fifth difference interpolation formula was used to estimate the percent ever married by tenths of a year of age from census figures and from the sample survey data. Since the interpolation was based on the percent ever married for 5-year age groups in the survey data, and since this percent is sensitive to changes in the distribution by single years of age within the age groups when most first marriages take place, the resulting median age at first marriage from the survey may fluctuate sharply in response to the major changes that have recently taken place in the age composition of the 20- to 24-year-old age group. The effect is marked in the case of the median age of men at first marriage because this median falls near the center of a 5-year age group. The median age of women at first marriage is relatively unaffected because little interpolation is required for its calculation; this median is now close to exact age 20, which is the lower limit of the age group.

The median age at first marriage computed from data on either annual marriage records

or census questions on age at first marriage involves people over the full age span rather than just those in the vicinity of the halfway point. Median ages at first marriage based on these other records may be affected by changes in the age distribution of the population, whereas the median age at first marriage for a given date shown in the present report can be interpreted as applying to the cohort born "n" years earlier, where "n" is the median age at first marriage. Data on age at first marriage are available from marriage records only for certain States and from census questions only for selected dates.

When the figures on median and quartile ages at first marriage for different years are compared, caution should be exercised in the interpretation of small changes. Because of sampling variability of the survey data and the limitations of the estimating technique itself, the errors in the estimates of the median age may be slightly larger than annual changes of one- or two-tenths of a year of age. Moreover, there is evidence that computation of the median age at first marriage for men in some years is affected by changes in the distribution by single years of age within the age groups when most first marriages take place; changes of up to one-half year in the median for men may reflect this factor rather than any real change taking place in the ages of men at first marriage.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment, or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. Group quarters are defined as noninstitutional living arrangements for groups containing five or more persons unrelated to the person in charge. Inmates of institutions (starting in 1972) are not included in the Current Population Survey.

Family status. Within households, persons who are family members are distinguished from those who are not family members. A family is defined as a group of two or more persons residing together who are related by blood, marriage, or adoption; all such persons are considered as members of one family even though they may include a "subfamily," that is, a married couple or a parent-child group sharing the living quarters of the family head. A primary family includes among its members the head of a household, and a "secondary family" includes no member related to the household head. Members of secondary families may include persons such as lodgers, guest, or resident employees and their relatives living in a household.

Persons living with relatives in group quarters were formerly considered as members of secondary families. However, the number of such families became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with the census data for 1960) the Bureau of the Census includes persons in these families in the count of secondary individuals.

In this report, persons who are not family members (that is, are not recognized as living with any relatives) are "unrelated individuals." Unrelated individuals are of two types--primary and secondary. A "primary individual" is a household head with no relatives in the household. A "secondary individual" is a lodger, partner, guest, or resident employee with no relatives in the household or group quarters.

Income. For the noninstitutional population 14 years old and over, questions were asked on the amount of money income received in 1973. The amounts received represent income before deductions for personal taxes, Social Security, bonds, etc. Although the income statistics refer to receipts during 1973, the characteristics of the person, such as age, marital status, etc., refer to March 1974.

Years of school completed. In this report data on years of school completed were derived from the combination of answers to two questions, (a) "What is the highest grade of school that he has attended?" and (b) "Did he finish this grade?"

The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, "regular" schooling is that which

advances a person toward an elementary or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

COMPARABILITY OF ESTIMATES FROM MARCH 1974 CPS WITH ESTIMATES FOR PRECEDING YEARS

The data for 1974 collected in the March 1974 Current Population Survey (CPS) are, in some instances, not entirely comparable to figures for earlier years because of revisions in the Current Population Survey. Starting in January 1972, 1970 census-based population controls, metropolitan residence definition, and other materials were introduced into the sample and estimation procedures. The major item affecting comparability at the overall national level is the introduction of population controls based on the 1970 census. Figures for previous years are tied in with 1960 census-based population controls. Basically, these changes should have no substantial impact on summary measures, such as medians and means, and on proportional measures, such as percent distributions. However, the changes may have more impact on the population levels in different subgroupings such as the total number of persons or families either overall, or within some particular category.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data. The data for this report for the years 1947-1974 are based on results obtained in the Current Population Survey (CPS) of the Bureau of the Census. Any data before 1947 are based on the Decennial Censuses.

The present Current Population Survey sample which was instituted between December 1971 and March 1973, is spread over 461 areas comprising 923 counties and independent cities with coverage in each of the 50 states and the District of Columbia. Approximately 47,000 occupied households are eligible for interview each month. Of this number 2,000 occupied units, on the average, are visited but interviews are not obtained because the occupants are not found at home after repeated calls or are unavailable for some other reason. In addition to the 47,000, there are also about 8,000 sample units in an average month which are visited but are found to be vacant or otherwise not to be interviewed.

From January 1967 through June 1971, approximately 50,000 occupied housing units were eligible

for interview each month. The data collected in 1960 in the CPS was based on a sample spread over 333 areas comprising 638 counties and independent cities with coverage in the 48 states and the District of Columbia. Approximately 35,000 occupied households were eligible for interview each month. Approximately 21,000 households were eligible for interview each month in samples taken before May 1956.

The estimating procedure used for the 1970-1974 data involved the inflation of weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from the 1970 Census of Population, statistics on births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces (Report No. 225 in this series showed somewhat different figures for 1970 since the data in that report were inflated to independent estimates of the population based on 1960 census data.) For data collected in the Current Population Surveys in the years 1960-69, the independent estimates used were based on statistics from the 1960 Census of Population.

Vital Statistics Data. Data on the total number of divorces that occurred in the United States are published by the National Center of Health Statistics. They are estimates based on the states in the Divorce Registration Area, weighted to the national level.

Reliability of the estimates. Since the estimates are based on a sample they may differ somewhat from the figures obtained if a complete census had been taken using the same schedules, instructions, and enumerators. As in any survey work, the results are subject to errors of response and of reporting as well as being subject to sampling variability.

The standard error is primarily a measure of sampling variability; that is, of the variations that occur by chance because a sample rather than the whole of the population is surveyed. As calculated for this report, the CPS standard errors also partially measure the effect of response and enumeration errors but do not measure any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the CPS sample would differ from a complete census figure by less than the standard error. The chances are about 90 out of 100 that the difference would be less than 1.6 times the standard error, and the chances are about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard-error level or better. Most are significant at a level of more than 2.0 standard errors. Thus, for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g. by use of the phrase "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

The figures presented in tables H, I, J, K, L, and M are approximations to the standard errors of various estimates shown in this report. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, the tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item.

Tables H and I contain the standard errors of estimates of the number of persons in a given class. Table H contains standard errors of the number of total or white persons and table I contains the standard errors of the number of persons of Negro and other races. Table L contains the standard errors of estimates of numbers of families, households, or unrelated individuals. Table L should also be used for items which can typically appear only once in a given household as, for example, "Number of household heads," or "Number of female household heads."

Table H. STANDARD ERRORS OF ESTIMATED NUMBER OF PERSONS, TOTAL OR WHITE POPULATION: 1967 AND LATER YEARS

(68 chances out of 100)

Size of estimate	Standard error	Size of estimate	Standard error
20,000.....	8,400	1,000,000....	59,000
30,000.....	10,200	2,500,000....	93,000
40,000.....	11,800	5,000,000....	131,000
50,000.....	13,200	10,000,000...	182,000
100,000.....	19,000	25,000,000...	277,000
250,000.....	30,000	50,000,000...	362,000
500,000.....	42,000	100,000,000..	419,000

Note: For June 1956 through 1967, multiply these standard errors by 1.2. For the period before June 1956, multiply these standard errors by 1.6.

Table I. STANDARD ERRORS OF ESTIMATED NUMBER OF PERSONS, NEGRO AND OTHER RACES: 1967 AND LATER YEARS

(68 chances out of 100)

Size of estimate	Standard error	Size of estimate	Standard error
20,000.....	9,800	500,000.....	48,000
30,000.....	12,000	1,000,000....	68,000
40,000.....	13,800	2,500,000....	104,000
50,000.....	15,500	5,000,000....	138,000
100,000.....	22,000	10,000,000...	169,000
250,000.....	34,000		

Note: For June 1956 through 1967, multiply these standard errors by 1.2. For the period before June 1956, multiply these standard errors by 1.6.

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerator of the percentages, particularly if the percentages are 50 percent or more.

Table J shows the standard errors of estimated percentages of total or white persons for different sizes of the bases of the percentages. Table K shows the standard errors of estimated percentages of persons of Negro and other races. Table M contains the standard errors of estimates of percentages of families, households, or unrelated individuals. The guideline used to decide whether table L is appropriate for a particular item should also be used for deciding the use of table M.

Note when using small estimates. Percentage distributions are shown in this report only when the base of the percentage is greater than 75,000. Because of the large standard errors involved, there is little chance that percentages would reveal real information when computed on a smaller base. Estimated totals are shown, however, even though the relative standard errors of these totals are larger than those for the corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

Estimates of divorced persons per 1,000 married persons with spouse present. The standard error on an estimate of the number

50.....	15.5	10.9	6.9	4.9	3.5	2.2	1.5	1.1

Note: For June 1956 through 1967, multiply these standard errors by 1.2. For the period before June 1956, multiply these standard errors by 1.6.

of divorced persons per 1,000 married persons with spouse present cannot be calculated directly from these standard error tables. The estimate involves the ratio of the total persons divorced, x , to the total number of married persons with spouse present, y , multiplied by 1,000. The standard error of this estimate is calculated by the following formula:

$$\sigma_{\frac{x}{y}} (1000) = \left[\left(\frac{x}{y} \right)^2 \left(\frac{\sigma_y^2}{y^2} + \frac{\sigma_x^2}{x^2} \right) \right]^{\frac{1}{2}} \times 1,000$$

The standard errors of the estimates of the total number of divorced persons σ_x and the standard error of the total number of married persons with spouse present σ_y should both be calculated from table H.

Table L. STANDARD ERRORS OF FAMILY, HOUSEHOLD, OR UNRELATED INDIVIDUAL ESTIMATES: 1967 AND LATER YEARS

(68 chance out of 100)

Size of estimate	Standard error	Size of estimate	Standard error
20,000.....	5,200	1,000,000....	36,000

50.....	8.2	5.8	3.7	2.6	1.8	1.2	0.8	0.6	0.4	0.3

Note: For June 1956 through 1967, multiply these standard errors by 1.2. For the period before June 1956, multiply these standard errors by 1.6.

Illustration of the use of tables of standard errors. Table G of this report shows that there were 2,333,000 divorced males as of March 1974. Table H shows the standard error on an estimate of this size to be approximately 89,000. The chances are 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than 89,000. The chances are 95 out of 100 that the estimate would have differed from a complete census figure by less than 178,000. Of these 2,333,000 divorced men, 61.2 percent were heads of households. Table M shows the standard error of 61.2 percent on a base of 2,333,000 to be approximately 1.2 percent. Consequently, chances are 68 out of 100 that the estimated 61.2 percent would be within 1.2 percentage points of a complete census figure, and chances are 95 out of 100 that the estimate would be within 2.4 percentage points of a census figure; i.e., this 95 percent confidence interval would be from 58.8 to 63.6 percent.

Differences. For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squares of the standard errors of each estimate considered separately. This formula will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between

separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

Illustration of the computation of the standard error of a difference. Table G of the report shows that in 1970 there were 1,479,000 divorced men. Thus, the apparent difference between divorced males in 1970 and 1974 is 854,000. The standard error of 2,333,000 is 89,000 as shown above. Table H shows the standard error on an estimate of 1,479,000 to be approximately 70,000. The standard error of the estimated difference of 854,000 is about $113,000 = \sqrt{(89,000)^2 + (70,000)^2}$. This means the chances are 68 out of 100 that the estimated difference based on the samples would differ from the change derived using complete census figures by less than 113,000. The 68 percent confidence interval around the 854,000 difference is from 741,000 to 967,000, i.e., $854,000 \pm 113,000$. A conclusion that the average estimate of the change derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95 percent confidence interval is 628,000 to 1,080,000, and thus we can conclude with 95 percent confidence that the number of divorced men in 1974 is actually greater than the number of divorced men in 1970.

Table 1. Marital Status by Age, Race, Farm-Nonfarm Residence, and Sex: March 1974 and 1970

(Numbers in thousands. This report excludes inmates of institutions. It includes 1,067,000 members of the Armed Forces in 1974 who were living off post or with their families on post but excludes all other members of the Armed Forces)
